The following revision of the orbit of comet 1929 I is based on the elements computed by Dr. S. KANDA (T. A. B. 41—42). These elements are as follows:

$$\left.\begin{aligned} T &= 1929\ \text{March}\ 23.25926\ \text{U. T.} \\ \omega &= 357^{\circ}.76403 \\ \Omega &= 126.32592 \\ i &= 3.72893 \\ e &= 0.3950135 \\ a &= 3.455363 \\ \mu &= 0.1534488 \end{aligned}\right\} \begin{matrix} \\ \\ 1950.0 \\ \\ \\ \\ \end{matrix} \qquad \text{(I)}$$

$$\left.\begin{aligned} x &= -1.936\ 9388\ (\cos E - e) - 2.623\ 4602 \sin E \\ y &= +2.628\ 6605\ (\cos E - e) - 1.710\ 7396 \sin E \\ z &= +1.130\ 4612\ (\cos E - e) - 0.517\ 0711 \sin E \end{aligned}\right\} 1950.0$$

From these elements I have computed the perturbed co-ordinates of the comet from 1929 to 1935 (A. N. 6069 and Copenhagen Observatory Publ. 102).

The comet was rediscovered by Professor VAN BIESBROECK on 1934 Dec. 11. A comparison with the ephemeris gave the following residuals:

$$\Delta\alpha \cos\delta = +150^{s},\ \Delta\delta = +780''.$$

From the above mentioned computation I found for 1934 Dec. 11.11181 U. T. the following approximate per-

turbations as differences between the perturbed and unperturbed co-ordinates:

$$\left.\begin{aligned} \xi &= +0.04978 \\ \eta &= -0.01415 \\ \zeta &= -0.00832 \end{aligned}\right\} 1950.0$$

From these perturbations and the following observations:[1]

1929 Febr.	U. T. 1.0	$5^h38^m15^s.04$	$+21°10'\ 4''.3$ Normal place Nr. 1 (20 obs.)
1929 March	31.0	6 35 54.50	+23 14 36.1 Normal place Nr. 2 (7 obs.)
1934 Dec.	11.11181	1 43 24.31	+ 5 21 31.7 Yerkes

and using the method of the variation of the geocentric distances for the times 1929 Febr. 1.0 and 1929 March 31.0 I have computed the following revised elements:

Epoch and osculation: 1929 Febr. 18.0 U. T.

$$\left.\begin{aligned} M &= 354°.90992 \\ \omega &= 357.71314 \\ \Omega &= 126.32675 \\ i &= 3.72833 \end{aligned}\right\} 1950.0 \qquad (II)$$
$$\begin{aligned} e &= 0.3945110 \\ a &= 3.452618 \\ \mu &= 0.1536318 \end{aligned}$$

$$\left.\begin{aligned} x &= -1.932\ 906\ (\cos E - e) - 2.623\ 552 \sin E \\ y &= +2.628\ 200\ (\cos E - e) - 1.707\ 662 \sin E \\ z &= +1.130\ 052\ (\cos E - e) - 0.515\ 907 \sin E \end{aligned}\right\} 1950.0$$

[1]) All the observations and normal places are referred to the equinox for the beginning of the year of observation.

Using these elements I have repeated the computation of perturbed equatorial co-ordinates from 1929 to 1936 (7 figure computation; the perturbations from Jupiter and Saturn are considered; attention has been paid to an essential part of the effect of the planets Merkur, Venus, Earth through the use of the value $k^2 = 0.0002959139$ which corresponds to the sum of the masses of these three planets and the Sun). The co-ordinates are:

	—	28.0	0.395 363	2.098 570	0.793 278
	May	18.0	+ 0.130 383	2.073 775	0.798 562
	June	7.0	— 0.135 962	2.026 760	0.795 289
	—	27.0	0.400 729	1.956 679	0.782 962
	July	17.0	0.660 677	1.863 191	0.761 268
	Aug.	6.0	0.912 399	1.746 560	0.730 117
	—	26.0	1.152 498	1.607 708	0.689 676
	Sept.	15.0	1.377 792	1.448 207	0.640 378
	Oct.	5.0	1.585 496	1.270 207	0.582 899
	—	25.0	— 1.773 376	+ 1.076 307	+ 0.518 126

From these co-ordinates α and δ have been found through interpolation and reduction to the equinox for the beginning of the year of observation, and the following residuals were found:

U. T.		$\Delta\alpha \cos\delta$	$\Delta\delta$	
1934 Dec.	11.11181	— 12^s.73	— 65″.2	Yerkes
— —	11.17500	— 12.87	— 67.2	»
— —	12.10558	— 12.75	— 65.9	»
1935 Febr.	6.80389	— 11.01	— 60.9	Bergedorf
— —	6.84194	— 12.03	— 67.1	»
— March	5.80424	— 11.64	— 62.5	»

which led to the normal places:

U. T.				
1934 Dec. 12.0	$1^h43^m14^s.64$	+5° 22′ 9″.6	Normal place	Nr. 3
1935 Febr. 7.0	2 11 57.78	+9 37 36.1	—	— 4

Comparison with all the normal places gave the result:

		U. T.	$\Delta\alpha \cos\delta$	$\Delta\delta$
Normal place	Nr. 1	1929 Febr. 1.0	— 0^s.20	— 0″.5
— —	— 2	1929 March 31.0	+ 0.17	— 0.2
— —	— 3	1934 Dec. 12.0	— 12.79	— 66.1
— —	— 4	1935 Febr. 7.0	— 11.43	— 62.5

As the large residuals in 1934 and 1935 presumably arise from the inaccuracy of the perturbations used for the revision I have computed new perturbations for 1934 Dec. 11 from the difference between the new perturbed co-ordinates and the unperturbed co-ordinates deduced from the elements (II). The new perturbations are for 1934 Dec. 11.11181 U. T.:

$$\left.\begin{aligned} \xi &= +0.048\ 392 \\ \eta &= -0.013\ 344 \\ \zeta &= -0.007\ 886 \end{aligned}\right\} 1950.0$$

From these values of the perturbations I have made a new revision, which gave the new set of elements:

Epoch and osculation 1929 Febr. 18.0 U. T.

$$\left.\begin{aligned} M &= 354.^{\circ}91062 \\ \omega &= 357.71203 \\ \Omega &= 126.32728 \\ i &= 3.72839 \end{aligned}\right\} 1950.0 \qquad \text{(III)}$$
$$\begin{aligned} e &= 0.3945470 \\ a &= 3.452821 \\ \mu &= 0.1536183 \end{aligned}$$

$$\left.\begin{aligned} x &= -1.932\ 993\ (\cos E - e) - 2.623\ 676 \sin E \\ y &= +2.628\ 374\ (\cos E - e) - 1.707\ 710 \sin E \\ z &= +1.130\ 122\ (\cos E - e) - 0.515\ 915 \sin E \end{aligned}\right\} 1950.0$$

Using these elements the computation of the perturbed equatorial co-ordinates for 1929—1936 has once more been repeated with the following result:

	U.T.		Equinox 1950.0. x	y	z
1929	Jan.	19.0	−0.378 371	+1.958 408	+0.782 290

Comparison with the 4 normal places then gave the residuals:

		U. T.		$\Delta\alpha \cos\delta$	$\Delta\delta$
Normal place Nr.	1	1929 Febr.	1.0	$-0^s.15$	$+0''.2$
— —	2	1929 March	31.0	+0.14	+0.1
— —	3	1934 Dec.	12.0	+0.02	+2.3
— —	4	1935 Febr.	7.0	−0.89	−5.5

The discrepancies between observation and computation are now so small that the orbit may be considered as fairly satisfactory. A revision based on the last computation of

perturbed co-ordinates should be postponed till the appearance of new observations.

From the co-ordinates and velocities for 1935 Oct. 5.0 I deduced the following osculating elements:

Epoch and osculation 1935 Oct. 5.0 U. T.

$$\left.\begin{aligned} M &= 5^\circ.74536 \\ \omega &= 357.97151 \\ \Omega &= 126.29158 \\ i &= 3.72853 \end{aligned}\right\} 1950.0 \qquad \text{(III a)}$$
$$\begin{aligned} e &= 0.3938329 \\ a &= 3.455860 \\ \mu &= 0.1534157 \end{aligned}$$

$$\left.\begin{aligned} x &= -1.945\,836\,(\cos E - e) - 2.619\,892 \sin E \\ y &= +2.623\,348\,(\cos E - e) - 1.719\,222 \sin E \\ z &= +1.129\,044\,(\cos E - e) - 0.520\,587 \sin E \end{aligned}\right\} 1950.0$$

As it may be possible to observe the comet during the winter 1935—36 I have computed the following ephemeris from the elements (III a).

0^h U. T.

1935	α 1935.0	δ 1935.0	Δ	r

The small inclination of the orbit and the distance of the aphelion 4.81 made a former proximity to Jupiter probable. In fact such a proximity took place in the first part of 1926.

To find the elements before this I have computed the co-ordinates backwards till 1920. From 1929 to 1924 Jupiter and Saturn were taken into consideration in a 7-figure computation, from 1924 to 1920 only Jupiter was considered and a 6-figure computation was used. The resulting equatorial co-ordinates were as follows:

			Equinox 1950.0.		
	U. T.		x	y	z

The figure on page 19 illustrates the abnormally large perturbations in the orbit of the comet near the proximity to Jupiter in 1926. The orbit is shown projected on the ecliptic (the inclination is always very small).

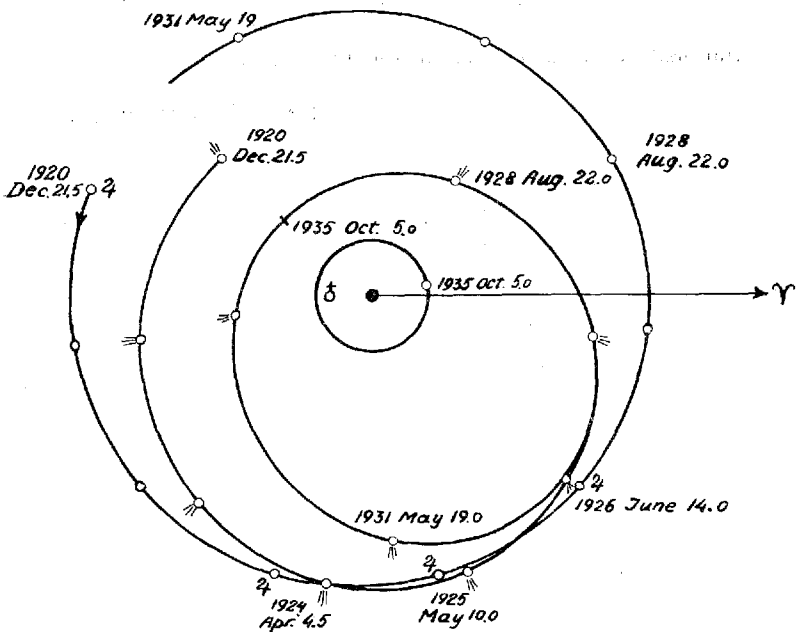
From the co-ordinates and velocities for 1921 March 11.5 I have deduced the following set of elements:

Epoch and osculation 1921 March 11.5 G. M. T.

$$\left.\begin{aligned} M &= 32^\circ.384 \\ \omega &= 335.462 \\ \Omega &= 126.681 \\ i &= 0.710 \end{aligned}\right\} 1950.0$$
$$\begin{aligned} e &= 0.19707 \\ a &= 4.4261 \\ \mu &= 0.10585 \end{aligned} \qquad \text{(III b)}$$

$$\left.\begin{aligned} x &= -0.93118\ (\cos E - e) - 4.24194 \sin E \\ y &= +3.97877\ (\cos E - e) - 0.85674 \sin E \\ z &= +1.70072\ (\cos E - e) - 0.31824 \sin E \end{aligned}\right\} 1950.0$$

I have not been successful in establishing any identity between these elements and any other set of elements in the tables of comets and asteroids.



The following table shows the distance of the comet from Jupiter for a number of dates from 1921 to 1928:

U.T. (resp. G.M.T.)			Δ
1928	Nov.	10.0	3.508
1927	Oct.	7.0	1.188
1926	Sept.	2.0	0.357
1925	July	29.0	0.438
1924	June	23.5	0.895
1923	May	20.5	1.078
1922	April	15.5	1.141
1921	March	11.5	2.055

On 1926 March 26 the distance had a minimum value: 0.179.

I am indepted to the Carlsbergfond for a grant, which enabled me to carry out the present investigation.

University Observatory, Copenhagen 1935 Aug. 9.
