THE MOTION OF COMET 1929 I  
(SCHWASSMANN-WACHMANN 2) IN THE  
YEARS 1936-1942

BY

HANS Q. RASMUSEN

KØBENHAVN

I KOMMISSION HOS EJNAR MUNKSGAARD

1941

Printed in Denmark.  
Bianco Luos Bogtrykkeri A/S.

In a previous publication<sup>1</sup> I have given the results of a calculation of the elements of periodic comet Schwassmann-Wachmann 2 from observations in the apparitions 1929-1934 as well as the perturbations during this period. The elements are:

Epoch and osculation 1929 February 18.0 U. T.

$$\begin{aligned}
 M &= 354^{\circ}.91062 \\
 \omega &= 357^{\circ}.71203 \\
 \Omega &= 126^{\circ}.32728 \\
 i &= 3^{\circ}.72839 \\
 e &= 0.3945470 \\
 a &= 3.452821 \\
 \mu &= 0^{\circ}.1536183
 \end{aligned}
 \left. \vphantom{\begin{aligned} \omega \\ \Omega \\ i \end{aligned}} \right\} 1950.0$$

Comparison of the computed orbit with selected observations showed so small residuals that it will hardly be worth while to revise the elements until observations from the opposition 1941-1942 are available. The elements are accurate enough for the purpose of calculating a search ephemeris for the opposition just mentioned. I have, therefore, continued the integration of the perturbed co-ordinates from 1936 to 1942. As before, account was taken of the attractions by Jupiter and Saturn.

<sup>1</sup>) D. Kgl. Danske Vidensk. Selskab, Math.-fys. Medd. XIII, 16 and Publikationer og mindre Meddelelser fra Københavns Observatorium Nr. 106.

The calculated co-ordinates, referred to the equinox 1950, are given in the following table.

	Feb. 10	- 1.157 278	+ 1.659 070	+ 0.710 564

From the co-ordinates and velocities the following osculating elements have been derived:

Epoch and osculation 1942 January 1.0 U. T.

$$\begin{array}{l}
 M = 353^{\circ}.38019 \\
 \omega = 358^{\circ}.00835 \\
 \Omega = 126^{\circ}.04333 \\
 i = 3^{\circ}.72521
 \end{array}
 \left. \vphantom{\begin{array}{l} M \\ \omega \\ \Omega \\ i \end{array}} \right\} 1950.0$$

$$\begin{array}{l}
 e = 0.3854489 \\
 a = 3.488424 \\
 \mu = 0^{\circ}.1512726
 \end{array}$$

According to this calculation the comet will pass through perihelion 1942 February 13.76080 U.T. The comet will be well placed for observation from November 1941.

The following ephemeris has been calculated with the elements just given.

		0 <sup>h</sup> U. T.				
1941		$\alpha_{1941.0}$	$\delta_{1941.0}$	$r$	$\Delta$
